Chapter 1 Introduction 1.1 Rationale Information about geometric algebra is widely available in the field of physics. Knowledge applicable to computer science, graphics in particular, is lacking.

### **Jaap Suter March 12, 2003**

In mathematics, a geometric series is a series with a constant ratio between successive terms. For example, the series  $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$  is geometric, because each successive term can be obtained by multiplying the previous term by  $1/2$ . Geometric series are among the simplest examples of infinite series with finite sums, although not all of them have this property.

In linear algebra, an  $n$ -by- $n$  square matrix  $A$  is called invertible (also nonsingular or nondegenerate) if there exists an  $n$ -by- $n$  square matrix  $B$  such that  $AB = BA = I_n$  where  $I_n$  denotes the  $n$ -by- $n$  identity matrix and the multiplication used is ordinary matrix multiplication. If this is the case, then the matrix  $B$  is uniquely determined by  $A$  and is called the inverse of  $A$ , denoted by  $A^{-1}$ .

This paper examines various aerodynamic optimisation methods. Benefits and drawback of architectures are discussed relating to aerodynamic optimisation.

## **State-of-the-art in aerodynamic shape optimisation methods**

Google Sheets supports cell formulas typically found in most desktop spreadsheet packages. These functions can be used to create formulas that manipulate data and calculate strings and numbers.
